Bachelor's or Master's Thesis: Numerical schemes on modern accelerator architectures

Supervisor: Jonas Große Sundrup (jonas.grosse-sundrup@kit.edu)

Background

Numerical methods are a core pillar of modern robotics research. This includes both Reinforcement Learning approaches as well as traditional Optimal Control approaches, both of which are internally based on optimization methods. The faster the optimization, the faster the methods based on it, the more efficient and effective the robot control and motion generation. Hence, it comes naturally to try to exploit emerging computing architectures to leverage them for the purpose of accelerating those respective methods.

Scope of the thesis

This thesis will focus on the evaluation of different numerical/optimization schemes on shared-memory architectures, with an emphasis on benchmarking and identification of bottlenecks. We want to identify the specific advantages and limitations of a shared memory architecture as well as the capabilities for accelerator offloading for robotics-related problems and beyond. The exact scope of the thesis depends on whether it is laid out as a Bachelor's or a Master's thesis.

Recommended knowledge

- fundamental knowledge about mathematical or numerical methods
- C++ programming experience
